DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on September 7th, 2007 has been entered.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 2-5 are rejected under 35 U.S.C. 102(b) as being anticipated by Wachi (JP 10-092100; machine translation relied upon).

Regarding claim 2:

Wachi discloses:

A rotational velocity controlling system in an information recording/reproducing apparatus which records and reproduces information on/from an information recording medium, the system comprising:

Application/Control Number: 10/786,080

Art Unit: 2627

revolution number detecting means for detecting the number of revolutions of the information recording medium (paragraph 33);

linear velocity detecting means for detecting the linear velocity at an information recording/reproduction position on the information recording medium (paragraphs 58-59);

control information generating means for generating rotation control information used for controlling the rotational velocity of the information recording medium based on the revolution number information obtained by the revolution number detecting means and the linear velocity information obtained by the linear velocity detecting means (paragraphs 78-81); and

driving means for rotating the information recording medium based on the rotation control information generated by the control information generating means (paragraphs 78-81).

wherein:

the control information generating means uses the revolution number information obtained by the revolution number detecting means and the linear velocity information obtained by the linear velocity detecting means to divide one of these information by the other (paragraph 78);

the control information generating means generates a revolution number error from the revolution number information based on an operation result value obtained by the division (paragraphs 80, 83: the apparatus determines the "detection location" of the spot; from the detection location determines the target revolution number; then

Application/Control Number: 10/786,080

Art Unit: 2627

compares the current revolution number to the target – this generates a revolution number error); and

the control information generating means outputs the revolution number error as the rotation control information to the driving means (paragraph 83).

Regarding claim 3:

In Wachi the control information generating means includes numerical range limiting means for limiting the numerical range of the operation result value (the operation result value is the detected location of the optical spot: since it is looked up in a table, as per paragraph 75, it is inherently limited to the entries in the table).

Regarding claim 4:

In Wachi the numerical range limiting means is upper limit means for limiting an operation result value which exceeds a predetermined value to the predetermined value (again, since the operation result value is the detected location, and it is looked up in a table, as per paragraph 75, there is inherently an upper limit to the value, which is the highest entry in the table; also, since the table lists locations on an optical disc, there will not be an entries for results larger than the disc).

Regarding claim 5:

Wachi discloses:

A rotational velocity controlling system in an information recording/reproducing apparatus which records and reproduces information on/from an information recording medium, the system comprising:

revolution number detecting means for detecting the number of revolutions of the information recording medium (paragraph 33);

linear velocity detecting means for detecting the linear velocity at an information recording/reproduction position on the information recording medium (paragraphs 58-59);

control information generating means for generating rotation control information used for controlling the rotational velocity of the information recording medium based on the revolution number information obtained by the revolution number detecting means and the linear velocity information obtained by the linear velocity detecting means (paragraphs 78-81); and

driving means for rotating the information recording medium based on the rotation control information generated by the control information generating means (paragraphs 78-81), and

abnormality detecting means for detecting occurrence of an abnormality in the output of the linear velocity detecting means according to a relationship between the revolution number information and the linear velocity information (paragraphs 80-82: the apparatus detects the position of the optical spot and then determines if the linear velocity is appropriate, increasing or decreasing it if necessary: if it is not appropriate, it is an abnormality).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Christopher R. Lamb whose telephone number is (571)

Application/Control Number: 10/786,080 Page 6

Art Unit: 2627

272-5264. The examiner can normally be reached on 9:00 AM to 6:30 PM Monday to Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, William Korzuch can be reached on (571) 272-7589. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
